Technical Glass Products
FIREFRAMES® ALUMINUM SERIES

Fireframes® Aluminum Series combined with Pilkington Pyrostop® fire-rated glass; provides a barrier to radiant and conductive heat transfer, allowing for unlimited areas of glazing in fire separations. The patented, high strength steel sub-frame assembly is only 2” (50.8mm) wide, yet has the strength for tall spans. The aluminum cover system gives the ultimate in durability and flexibility with many anodizing and coating options available. Fireframes Aluminum Series may incorporate Fireframes Designer Series doors or Fireframes Heat Barrier Series doors, and are classified and labeled with Underwriters’ Laboratories, Inc.® (UL) and Underwriters’ Laboratories of Canada (ULC).

General Information

This document is meant as a general description of typical installations. As such, it is the responsibility of the installer to ensure the window and doors are installed per the conditions that exist on any given project in accordance with these instructions and project drawings. TGP project drawings may detail modifications to the surrounding conditions required for a given project, (if architectural details or sketches were provided to TGP) and should be used in conjunction with these instructions. In the event of any conflict between these instructions and TGP project drawings, the TGP project drawings shall govern. TGP does not accept any warranty and/or liability for installations not in compliance with this document or other non-conforming use of the TGP products and/or system. Contact TGP with questions concerning these details as they apply to the particulars of a given project.

FEATURES

- Narrow steel profiles
- Easy installation
- Frames supplied “K-D” (knock-down) ready for installation
- Standard finish is clear anodized. Powder coating and other anodized finishes are available.
- Incorporates large individual panes of Pilkington Pyrostop® comprised of low-iron Pilkington OptiWhite™ glass
- Passes positive pressure test standards UL 10C.

LISTINGS

- Classified and labeled by Underwriters Laboratories, Inc.® (UL) as Design Number U558 and Underwriters Laboratories of Canada (ULC) as U416.
- Test report number for labeled 45/60/120 minute fire-rated frame assemblies is UL File No. R-19207.
- Frame tested in accordance with UL 263, ASTM E119, for 60 and 120 minute ratings; CAN/ULC-S101, CAN4 S-106, NFPA 251, NFPA 257, UL 9, and UL 10C.
- Fireframes Designer Series and Fireframes Heat Barrier Series doors tested in accordance with UL 10B and UL 10C.
- Approved for use in Los Angeles – LARR 25798.

AMERICANS WITH DISABILITY ACT STANDARDS ON FIRE PROTECTION DOORS
If fire doors were required to meet A.D.A. (Americans with Disability Act) Standards, many would not open or close with adequate force to prevent passage of flame and smoke. Recognizing this special fire safety need, NFPA 101 (National Fire Protection Association) allows operational features for fire doors (opening forces, closing speeds, etc.) that are different than for non-fire-rated doors. These fire “protective” steel doors carry ratings from 20-90 minutes for fire protection. Heat transfer through the door is not an issue, so they are constructed without interior insulation.

DOORS IN FIREFRAMES ALUMINUM SERIES FRAMES
Fireframes Designer Series and Fireframes Heat Barrier Series door frames and doors may be installed into the Fireframes Aluminum Series frames. For more details on installation, refer to those specific product’s Architectural Specification Manuals.

Conventional fire-rated wood or hollow metal doors can also be installed into a Fireframes Designer Series door frame within the narrow profiled Fireframes Aluminum Series frame, but will require coordination with respect to preparation of door hardware. Prior to producing your shop drawings, TGP will need to evaluate relevant hardware schedule information. When ordering wood or hollow metal doors, you must supply our engineering staff with the manufacturer, model number, fabrication templates, door handing and, if required, physical samples. If TGP must prepare special fabrication drawings to accommodate your hardware needs, your project lead time may be extended.

FIRE-RATED GLAZING OPTIONS
Technical Glass Products provides a complete line of fire-rated glazing options to complement the Fireframes Designer Series or Fireframes Heat Barrier Series doors when used with the Fireframes Aluminum Series. Refer to those specific product’s Architectural Specification Manuals, or your Technical Glass Products SpeciFIRE® Selection Guide, available from your sales representative or online at www.fireglass.com.

Please consult your Technical Glass Products sales representative to determine the best option for your application.
GLAZING SPECIFICATIONS

Pilkington Pyrostop® fire resistant glass provides up to a two hour fire rating. It can also be combined with other glazing products to achieve nearly any level of security protection.

The Fireframes Aluminum Series framing system is available for 45 minute fire-rated windows and 60 or 120 minute transparent glass wall applications. Wall applications are UL rated as per UL263 / ASTM E119 and allow for large expanses of glass and frame. The 45 minute window systems are classified as an Opening Protective as per UL 9, ASTM E2010 with a maximum overall frame size of 152 square feet.

ANGLE SEGMENTED FRAMES (INTERIOR APPLICATION ONLY)

The horizontals and glass can be angled up to a maximum of 6 degrees on either side of the shared vertical mullion. See Figures 3 and 4.

Figure 3 - Segmented Frame Plan View

Figure 4 - Segmented Frame Detail
Recommended Guidelines

1. REVIEW CONTRACT DOCUMENTS
   Review architectural drawings, specifications, and approved TGP project drawings, installation instructions, and shipping lists to become thoroughly familiar with the project. The TGP project drawings take precedence and include specific details for your installation. These installation instructions are of a general nature and cover most conditions.

2. BUILDING CODES
   Due to the diversity in local, state/provincial, or federal laws and the codes that govern design and application of architectural products, it is the responsibility of the individual architect/owner and installer to ensure that products selected for use on projects comply with all the applicable building codes and laws. Technical Glass Products exercises no control over the use or application of its products, glazing materials, and operating hardware and assumes no responsibility thereof. Compliance of TGP project drawings with applicable codes for a given project shall be the responsibility of the Buyer.

3. COORDINATION WITH OTHER TRADES
   Coordinate with the general contractor any sequence with other trades which impact installation (i.e. fire proofing, back-up walls, partitions, ceilings, mechanical ducts, converters etc.) or in which installation may impact the work of adjacent trades.

4. INSTALLATION
   All materials are to be installed plumb and level.

5. BENCH MARKS
   All work should start from bench marks and/or column lines as established by the architectural drawings and the general contractor with guaranteed accuracy. Using these datum points and lines, determine:
   a. The plane of the wall in reference to offset lines provided on each floor;
   b. The finish floor lines in reference to bench marks on the outer building columns; and
   c. Mullion spacing from both ends of openings to prevent dimensional build-up of daylight opening.

6. SURROUNDING CONDITIONS
   a. Coordination of adjacent material and construction tolerances to TGP’s systems may be facilitated by TGP as part of preparing project drawings, and these drawings may indicate acceptable tolerances for critical dimensions. The installer should verify that surrounding construction is in accordance with the approved project drawings. Do not accept rough opening dimensions less than shown on project drawings. It is assumed that the minimal joint dimensions shown on the TGP project drawings match the field conditions. A frame may fit within a given opening but sealants may not perform as detailed if a smaller sealant joint is installed. Expansion/contraction issues may also be compromised. IF THE JOINTS ARE SMALLER THAN THAT SHOWN ON THE TGP PROJECT DRAWINGS, DO NOT PROCEED. Notify the General Contractor that the conditions are not as detailed and wait for corrective work to be completed before starting this work.
Recommended Guidelines

b. The installer MUST notify and receive approval from TGP and the general contractor when conditions are not in accordance with approved project drawings and/or change any aspect of the structural performance of the Fireframes series before making any modifications to the TGP-furnished material or making changes which are different from those shown on the TGP project drawings. These conditions include, but are not limited to, anchor placement/location, changes in adjacent materials the anchor is being connected to or changes to dimensional relationships between framing, anchors and connection to adjacent materials.

c. TGP must review and approve any changes required prior to the subcontractor installing any “corrective” work. These reviews may incur additional charges, which must be approved by the TGP customer prior to TGP’s review.

7. FRAME CONSTRUCTION VARIES
Depending on size restrictions, frames are shipped fully welded ready for installation or “K-D” (knock-down) to be assembled on site with mechanical joints.

8. FASTENING
Within the body of these instructions, “fastening” means any method of securing one part to another or to adjacent materials by means other than welding, adhering or using a mechanical fastener as shown on the approved details. Only those fasteners used within the system are specified in these instructions. Due to the varying perimeter conditions and performance requirements, perimeter and anchor fasteners are not specified in these instructions and are the responsibility of the installer.

9. SEALANTS
a. Sealants must be compatible with all materials they are in contact with, including other sealant surfaces. Consult with sealant manufacturer for recommendations relative to joint size, shelf life, compatibility, cleaning/priming, tooling, adhesion, etc.

b. The chemical compatibility and/or adhesion of all glazing materials and framing sealants with each other and with like materials used in glass and frame fabrication must be established by the installer. This is required on every project.

c. If required by the project specifications, it is the responsibility of the glazing contractor to submit any documentation or samples from the sealant manufacturer indicating that glass and glazing material has been tested for chemical compatibility and / or adhesion with glazing sealants. This applies to all TGP materials in contact with any sealant. TGP will furnish samples of these materials upon request.

d. The implementation of the test results is the responsibility of the installing contractor, and includes material performance and recommendations for primers and substrate preparation required to obtain adhesion.

10. PERIMETER JOINTS
Perimeter seals and/or expansion joints shown in these instructions and in the TGP project drawings are shown at nominal size. Actual dimensions may vary due to perimeter conditions and / or difference in metal temperature between the time of fabrication and the time of installation. Design and detailing have been based on a fabrication / installation temperature of 70° F (21° C). If extreme temperatures exist at time of installation, gaps between expansion members may require slight adjustment.
11. **CLAMPING SCREW TORQUE**

Edge pressure must not exceed 11.5 pounds per linear inch. This pressure is required on the Fireframes Aluminum Series mullion gaskets. It must be uniformly applied by the exterior mounted pressure plate, through the glass, to the mullion gaskets. Excessive or irregular edge pressure WILL CAUSE deformation and breakage.

12. **WATER HOSE TEST**

Exterior installations may require a water test in accordance with AAMA 501.2. As soon as a representative amount of the wall has been glazed (500 square feet or 46.5 square meters) a water hose test should be conducted. This test should be repeated for every 500 square feet (46.5 square meters), or as stipulated by specification, after all components have been installed.

13. **FIELD ANCHORS**

Steel anchors that are welded to steel structure or are bolted to embed must be line set before mullions are placed. Outstanding leg of anchors must be at 90° to offset lines. Mullion spacing should be held to ±1/32” (0.8 mm). Anchors may vary per job conditions. Always refer to approved project drawings for specific job site conditions.

   e. AWS-certified welders are recommended to be used to install all field weld conditions called out in the TGP project drawings. The responsibility of using experienced, certified welders is the installing contractor’s, not TGP’s.

   f. All field welding must be adequately shielded to avoid any splatter on glass or frame components. Results of inadequately shielded field welding will be unsightly and/or structurally unsound. Advise general contractor and other trades accordingly.

   g. TGP typically finishes all steel material to protect from corrosion during shipping and storage on site prior to installation. For powder coated finishes, it is required to grind off the finish at the expected weld location prior to welding operations. The field weld must be re-finished with a zinc rich primer (in unexposed areas) or with touch-up paint (in exposed areas) after the welding is completed. Welds should never be left unpainted or unfinished. TGP can furnish small quantities of touch-up paint as required to match the original finish.
45 Minute – Window Elevation

* 45 minute window systems are classified as an Opening Protective as per UL 9, with the maximum width or height dimension of 162”, while not exceeding 152 square feet.

** 60 and 120-minute tests conducted per UL 263 / ASTM E-119. Therefore assembly is classified as a wall assembly, and not subject to “opening” area limitations.
